Theorem 1 (Classical substitution). If $\Gamma, x : C \vdash P$ then $\Gamma \vdash P\{v/x\}$ for any real number v.

Proof. Follows routinely by induction over the type derivation system.

Theorem 2 (Quantum substitution). If $\Gamma, q : Q \vdash P$ then $\Gamma, r : Q \vdash P\{r/q\}$ for every quantum variable r : Q not in Γ .

Proof. Follows routinely by induction over the type derivation system. \Box

Theorem 3 (Type preservation). *If there exists a transition* $\langle P, \rho \rangle \xrightarrow{\alpha} \langle Q, \sigma \rangle$ *with probability greater than zero and* $\Gamma \vdash P$ *then* $\Delta \vdash Q$ *for some typing context* Δ .

Proof. The proof follows by induction over the transition derivation system. We also strengthen the induction invariant in the following way: if there exists a transition $\langle P, \rho \rangle \xrightarrow{\alpha} \langle Q, \sigma \rangle$ with probability greater than zero and $\Gamma \vdash P$ then $\Delta \vdash Q$ such that

$$\Delta^Q \subseteq \begin{cases} \Gamma^Q & \text{if } \alpha \neq \mathtt{c}?q \text{ and } \alpha \neq \mathtt{c}!q \\ \Gamma^Q, q:Q & \text{if } \alpha = \mathtt{c}?q \\ \Gamma^Q \setminus \{q:Q\} & \text{otherwise} \end{cases}$$

The proof for invisible actions, classical output, quantum output, and super-operators is direct. The proof for classical input is a consequence of Theorem 1 and the proof for quantum input is a consequence of Theorem 2. For the other cases, we proceed in the following way.

- 1. Consider the case of measuring qubits. The transition derivation system tells that the process M[q;x]. P can only reduce (i.e. reduce with probability greater than zero) to the simpler process P. Moreover, we know that $\Gamma, q:Q \vdash M[q;x]$. P entails $\Gamma, x:C \vdash P$. Both properties together prove our claim.
- 2. Consider now the case of relabelling. Assume that $\langle P[f], \rho \rangle \xrightarrow{f(\alpha)} \langle Q[f], \psi \rangle$ with probability greater than zero. Then it is also true that $\langle P, \rho \rangle \xrightarrow{\alpha} \langle Q, \psi \rangle$ with probability greater than zero. The proof then follows directly by the induction hypothesis. The case of restrictions and conditionals follow an analogous reasoning to the previous one.
- 3. We now consider the sum operator. Assume that $\langle P + \mathbb{Q}, \rho \rangle \xrightarrow{\alpha} \langle R, \psi \rangle$ with probability greater than zero. This entails that either $\langle P, \rho \rangle \xrightarrow{\alpha} \langle R, \psi \rangle$ with probability greater than zero or $\langle \mathbb{Q}, \rho \rangle \xrightarrow{\alpha} \langle R, \psi \rangle$ with probability greater than zero. We consider only the first case because the other is analogous. By assumption $\Gamma \vdash P + \mathbb{Q}$ and therefore $\Gamma \vdash P$. By the induction hypothesis we obtain $\Delta \vdash R$ for some Δ and then our claim follows directly.

- 4. Next, we consider constant processes. Assume that $\langle A(\tilde{q}), \rho \rangle \xrightarrow{\alpha} \langle P, \psi \rangle$ with probability greater than zero and that $\Gamma \vdash A(\tilde{q})$. Moreover, assume the existence of a defining equation $A(\tilde{q}) \stackrel{def}{=} \mathbb{Q}$ and recall that $\Gamma \vdash A(\tilde{q})$ entails $\Gamma \vdash \mathbb{Q}$ (an existing restriction over defining equations). The transition derivation system ensures that $\langle \mathbb{Q}, \rho \rangle \xrightarrow{\alpha} \langle P, \psi \rangle$. The proof then follows by the induction hypothesis.
- 5. We now consider the rule **Q-Com** in Table 1. Assume that $\langle P || Q, \rho \rangle \xrightarrow{\tau} \langle P' || Q', \rho \rangle$ with probability greater than zero. This entails that $\langle P, \rho \rangle \xrightarrow{c?r} \langle P', \rho \rangle$ and that $\langle Q, \rho \rangle \xrightarrow{c!r} \langle Q', \rho \rangle$ in both cases with probability greater than zero. By assumption we obtain $\Gamma_1 \vdash P$ and $\Gamma_2 \vdash Q$ with $\Gamma_1 \cap \Gamma_2 = \emptyset$. Moreover, by the induction hypothesis we obtain $\Delta_1 \vdash P'$ and $\Delta_2 \vdash Q'$ with $\Delta_1^Q \subseteq \Gamma_1^Q, r : Q$ and $\Delta_2^Q \subseteq \Gamma_2 \setminus \{r : Q\}$. Since $\Gamma_1^Q \cap \Gamma_2^Q = \emptyset$ we obtain $\Delta_1^Q \cap \Delta_2^Q = \emptyset$ and therefore $\Delta_1 \cup \Delta_2 \vdash P' \mid| Q'$. The proof for the rules **C-Com**, **Inp-Int**, and **Oth-Int** follows a similar reasoning.

To make it easier for the reader to follow the proof, the transition rules of qCCS [1] are presented in Table 1.

Tau:
$$\overline{\langle \tau.P, \rho \rangle \xrightarrow{\tau} \langle P, \rho \rangle}$$

C-Inp:
$$\langle c?x.P, \rho \rangle \xrightarrow{c?v} \langle P\{v/x\}, \rho \rangle$$
 $v \in \text{Real}$

$$\textbf{C-Outp:} \quad \frac{}{\left\langle \right. c!e.\texttt{P}, \rho \left. \right\rangle \xrightarrow{-c!v} \left\langle \right. \texttt{P}, \rho \left. \right\rangle } v = \llbracket e \rrbracket$$

$$\textbf{Q-Inp:} \quad \overline{\left\langle \ \mathsf{c}?q.\mathtt{P}, \ \rho \ \right\rangle \xrightarrow{\mathtt{c}?r} \left\langle \ \mathtt{P}\{r/q\}, \ \rho \ \right\rangle} \ r \notin qv(\mathtt{c}?q.\mathtt{P})$$

Q-Outp:
$$\langle c!q.P, \rho \rangle \xrightarrow{c!q} \langle P, \rho \rangle$$

Oper:
$$\overline{\langle \varepsilon[\tilde{q}].P, \rho \rangle \xrightarrow{\tau} \langle P, \varepsilon_{\tilde{q}}(\rho) \rangle}$$

 $\begin{array}{ll} \textbf{Meas:} & \overline{\langle \ \texttt{M}[\tilde{q};x].\texttt{P},\rho \ \rangle^{\frac{\tau}{\rightarrow}} \sum_{i \in I} p_i \langle \ \texttt{P}\{\lambda_i/x\}, E^i_{\tilde{q}} \rho E^i_{\tilde{q}}/p_i \ \rangle}} \\ \text{where \texttt{M} has the spectral decomposition } \texttt{M} = \sum_{i \in I} \lambda_i E^i \text{ and } p_i = tr(E^i_{\tilde{q}} \rho) \end{array}$

Sum:
$$\frac{\langle P, \rho \rangle \xrightarrow{\alpha} \mu}{\langle P + \mathbb{Q}, \rho \rangle \xrightarrow{\alpha} \mu}$$

$$\mathbf{Rel:} \quad \frac{\langle \ \mathsf{P}, \ \rho \ \rangle \xrightarrow{\alpha} \boxplus p_i \bullet \langle \ \mathsf{P}_\mathtt{i}, \ \rho_i \ \rangle}{\langle \ \mathsf{P}[\mathtt{f}], \ \rho \ \rangle \xrightarrow{f(\alpha)} \boxplus p_i \bullet \langle \ \mathsf{P}_\mathtt{i}[\mathtt{f}], \ \rho_i \ \rangle}$$

$$\mathbf{Res:} \quad \frac{\langle P, \rho \rangle \xrightarrow{\alpha} \boxplus p_i \bullet \langle P_i, \rho_i \rangle}{\langle P \backslash L, \rho \rangle \xrightarrow{\alpha} \boxplus p_i \bullet \langle P_i \backslash L, \rho_i \rangle} \ cn(\alpha) \not\subseteq L$$

$$\begin{array}{ccc} & \frac{\langle \ \mathbf{P}, \ \rho \ \rangle \overset{\alpha}{\longrightarrow} \mu}{\langle \mathbf{if} \ b \ \mathbf{then} \ \mathbf{P}, \ \rho \rangle \overset{\alpha}{\longrightarrow} \mu} \ \llbracket b \rrbracket = true \end{array}$$

$$\mathbf{Def:} \quad \frac{\langle \ \mathbf{P}\{\tilde{r}/\tilde{q}\}, \ \rho \ \rangle \xrightarrow{\alpha} \mu}{\langle \mathbf{A}(\tilde{r}), \ \rho \rangle \xrightarrow{\alpha} \mu} \ \mathbf{A}(\tilde{q}) \overset{def}{=} \mathbf{P}$$

$$\frac{\langle \ \mathbf{P}, \ \rho \ \rangle \xrightarrow{\mathsf{c}?r} \langle \ \mathbf{P}', \ \rho \ \rangle}{\langle \ \mathbf{P} \ || \ \mathbf{Q}, \ \rho \ \rangle \xrightarrow{\mathsf{c}?r} \langle \ \mathbf{P}' \ || \ \mathbf{Q}, \ \rho \ \rangle} \ r \not\in qv(\mathbf{Q})$$
Inp-Int:

$$\begin{array}{ll} \textbf{Oth-Int:} & \frac{\langle \ \mathtt{P}, \ \rho \ \rangle \xrightarrow{\alpha} \boxplus_{i \in I} p_i \bullet \langle \ \mathtt{P'_i}, \ \rho_i \ \rangle}{\langle \ \mathtt{P} \ || \ \mathtt{Q}, \ \rho \ \rangle \xrightarrow{\alpha} \boxplus_{i \in I} p_i \bullet \langle \ \mathtt{P'_i} \ || \ \mathtt{Q}, \ \rho_i \ \rangle} \ \alpha \neq \mathtt{c}?r \\ & \text{Table 1: SOS rules QCCS} \end{array}$$

With the same purpose as previously, the type system developed for QCCS [2] is presented in Table 2.

$$(\text{NIL}) \quad \overline{\Gamma \vdash nil} \qquad \qquad (\text{CONST}) \quad \frac{\tilde{q} \subseteq \Gamma}{\Gamma \vdash \mathtt{A}(\tilde{q})}$$

$$(\text{INV}) \quad \frac{\Gamma \vdash \mathbf{P}}{\Gamma \vdash \tau.\mathbf{P}} \qquad \qquad (\text{OP}) \quad \frac{\Gamma \vdash \mathbf{P} \quad \tilde{q} \subseteq \Gamma^Q}{\Gamma \vdash \varepsilon[\tilde{q}].\mathbf{P}}$$

$$\begin{array}{ll} \text{(C-OUT)} & \frac{\Gamma \vdash \mathtt{P} \quad fv(e) \subseteq \Gamma^C}{\Gamma \vdash c! e.\mathtt{P}} & \text{(C-IN)} & \frac{\Gamma, x : C \vdash \mathtt{P}}{\Gamma \vdash c ? x.\mathtt{P}} \end{array}$$

$$(\text{Q-IN}) \quad \frac{\Gamma, q: Q \vdash \mathtt{P}}{\Gamma \vdash \mathtt{c}?q.\mathtt{P}} \qquad \qquad (\text{Q-OUT}) \quad \frac{\Gamma \vdash \mathtt{P}}{\Gamma, q: Q \vdash \mathtt{c}!q.\mathtt{P}}$$

$$(\text{MEAS}) \quad \frac{\Gamma, x : C \vdash \mathtt{P}}{\Gamma, q : Q \vdash \mathtt{M}[q; x].\mathtt{P}} \qquad \qquad (\text{SUM}) \quad \frac{\Gamma_1 \vdash \mathtt{P} \qquad \Gamma_2 \vdash \mathtt{Q}}{\Gamma_1 \cup \Gamma_2 \vdash \mathtt{P} + \mathtt{Q}}$$

$$(\text{REL}) \quad \frac{\Gamma \vdash \mathtt{P}}{\Gamma \vdash \mathtt{P}[f]} \qquad \qquad (\text{RES}) \quad \frac{\Gamma \vdash \mathtt{P}}{\Gamma \vdash \mathtt{P} \setminus \mathtt{L}}$$

(IF)
$$\begin{array}{c|cccc} \Gamma \vdash P & \Delta \vdash b \\ \hline \Gamma, \Delta \vdash \textbf{if } b \textbf{ then } P & \text{(COMM)} \end{array} & \begin{array}{c|ccccc} \Gamma_1 \vdash P & \Gamma_2 \vdash \mathbb{Q} & \Gamma_1^Q \cap \Gamma_2^Q = \emptyset \\ \hline & \Gamma_1 \cup \Gamma_2 \vdash P \mid\mid \mathbb{Q} \end{array} \\ \hline & \text{Table 2: QCCS type rules} \end{array}$$

Remark. The rule (C-OUT) presented in Table 2, is different of the one in [2].
